

HOW CAN WE MYND BETTER

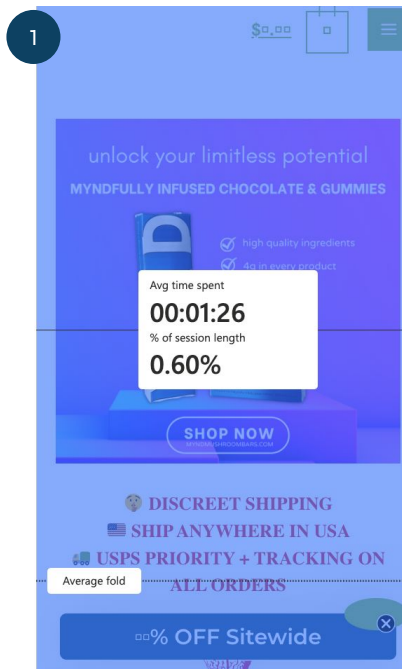

Clickmap & Scroll Map Analysis

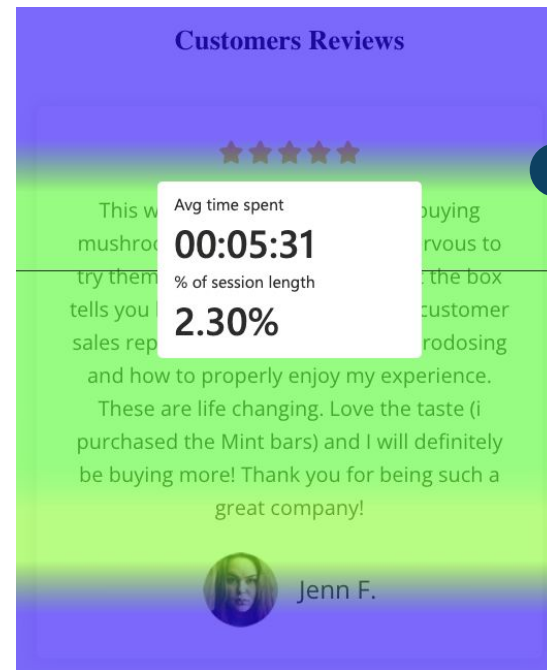

HP-Areas of HIGH interest

1. Users spent almost 90 seconds trying to understand the banner and product description, suggesting the section should be clearer so they can decide whether to proceed or scroll more quickly.
2. Users spent over 5 minutes reading reviews, and many continued scrolling, indicating that social proof is an essential part of the conversion strategy.

Reviews section

Menu-Areas of HIGH interactivity

1. 4.21% click the shop menu hyperlink, showing strong interest in viewing all products before making a decision.
2. 9.47% click the chocolate bars menu hyperlink, showing high interest from the start in viewing chocolate bars.
3. 3.16% click the gummies menu hyperlink, making it the second most desirable product in the menu.
4. 1.05% click the capsules menu hyperlink, indicating low interest in capsules.
5. 1.05% click the contact menu hyperlink.
6. 3.16% click the cart hyperlink.

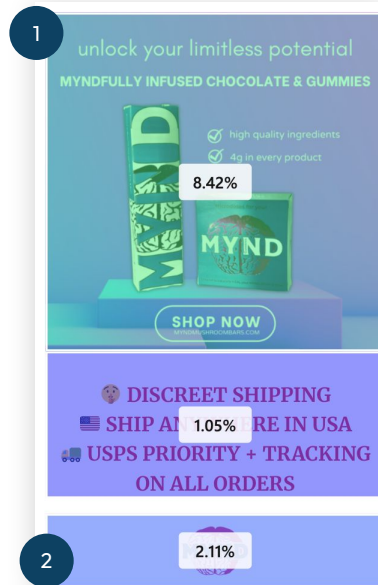

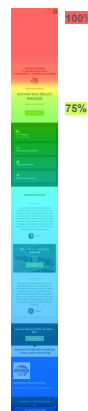

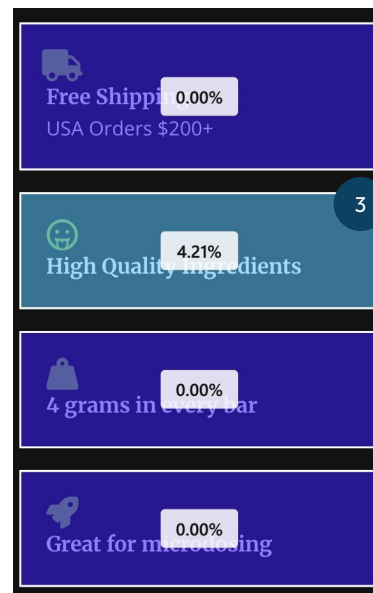

HP-Areas of HIGH interactivity

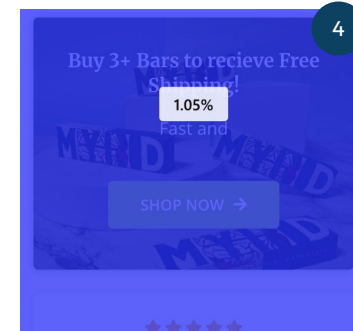

1. There is strong interest in the main banner – users naturally click on it when viewing the products, so we can keep a similar layout.
2. Users often click on the brain logo, assuming it is a button or something interactive. We can remove it to avoid misclicks and place the logo at the top of the page to redirect to the homepage.
3. Within the banners that show benefits, users show the most interest in the high quality ingredient angle.
4. The offer to buy three bars and receive free shipping also attracts many clicks. Free shipping draws attention.

CP-Areas of HIGH interest

1. We lose almost 30% of users at the start before they even see our chocolate bars, which are the most important products displayed.
2. After the chocolate bars are shown, we lose more than 50% of users, indicating a drop in interest after the main products.
3. Only 23% of users see the box options, even though these usually bring higher order values and increase our ticket.

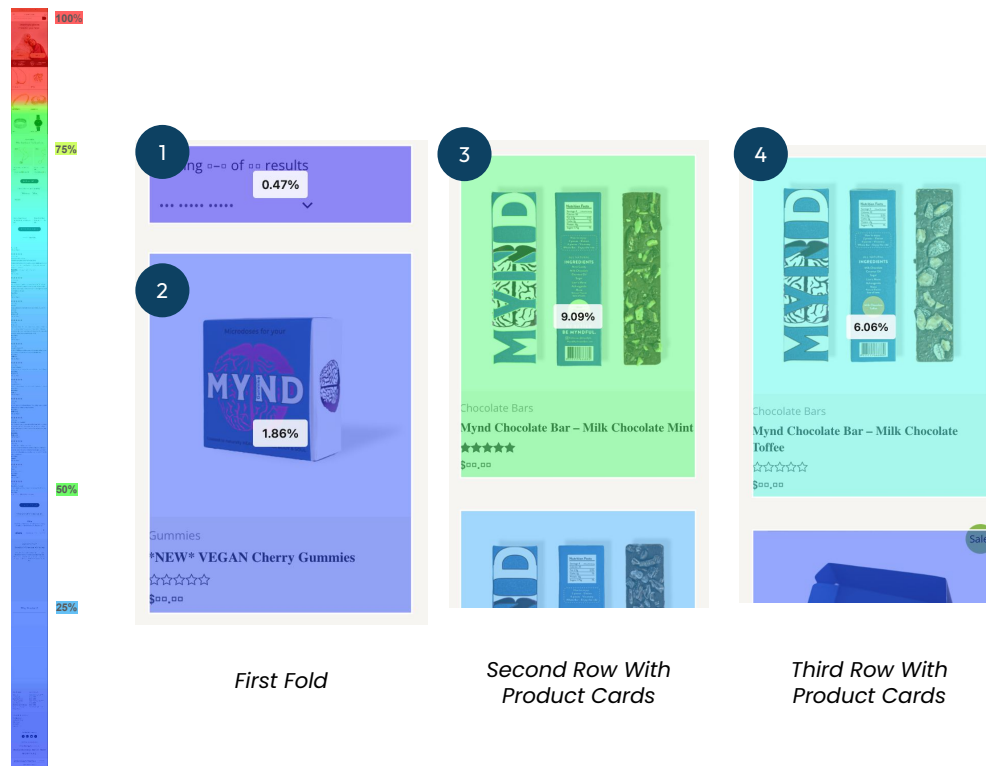

CP-Areas of HIGH interactivity

1. Less than 0.5% of users click to change the order of result. Different layout would likely attract more clicks and make it useful.
2. Only 1.85% of users click the first product, indicating it is not the best item to display in the top position.
3. Mynd Chocolate Bar is the most clickable product and the one with the most reviews.
4. The Mynd Chocolate Bar milk chocolate also receives many clicks, showing strong interest in bars.

Product Cards

CP-Areas of HIGH interactivity

1. People are interested in navigating to more pages, so infinite scrolling could work well since the catalog is small.
2. People want to filter by price and product categories, but these options currently appear only at the bottom of the page.

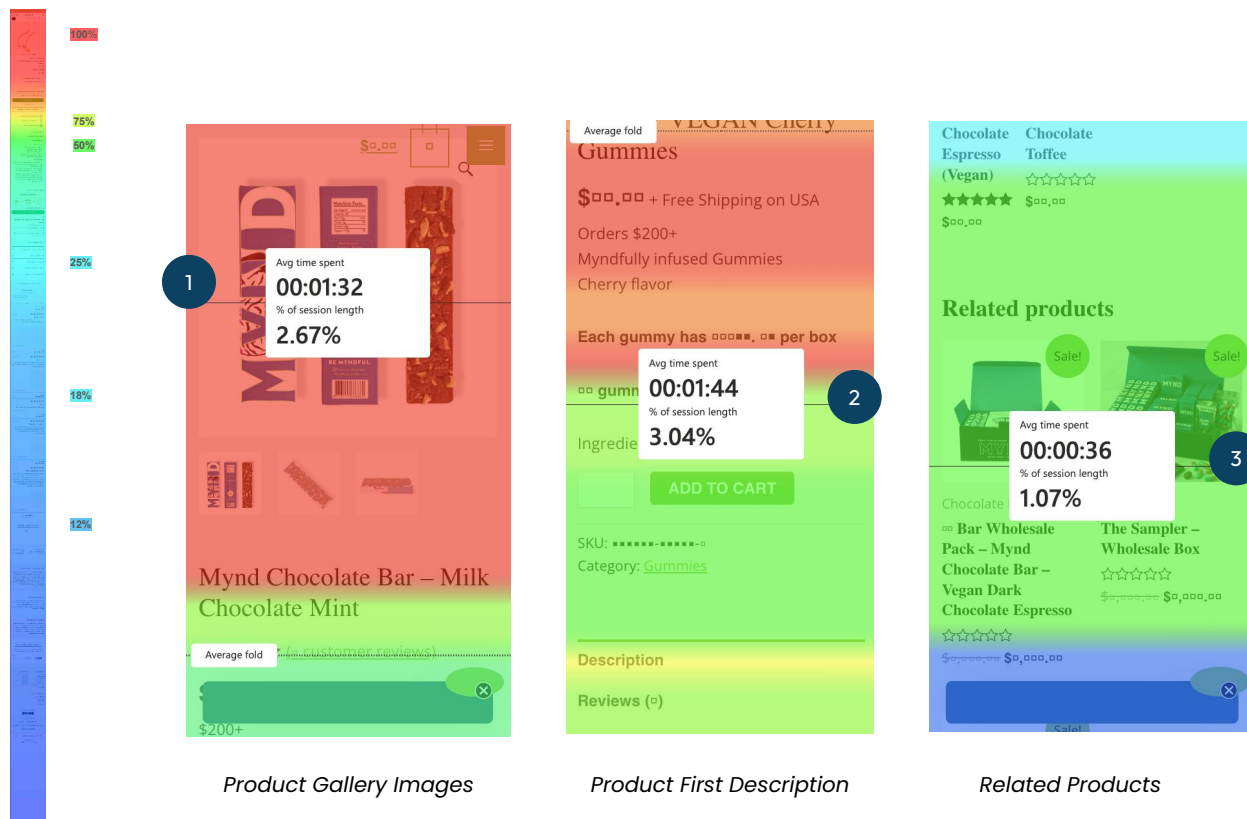

PP-Areas of HIGH interest

1. Users spend 90 seconds just checking images in the product gallery, showing this is a key section for adding benefits, varied angles, and images that persuade people to keep scrolling.
2. Users spend almost 2 minutes and continue scrolling after seeing the first product description, showing this is an important area to keep more information while avoiding placing the entire description too far below.
3. Related products also attract strong visibility and interaction, suggesting we should place this content earlier.

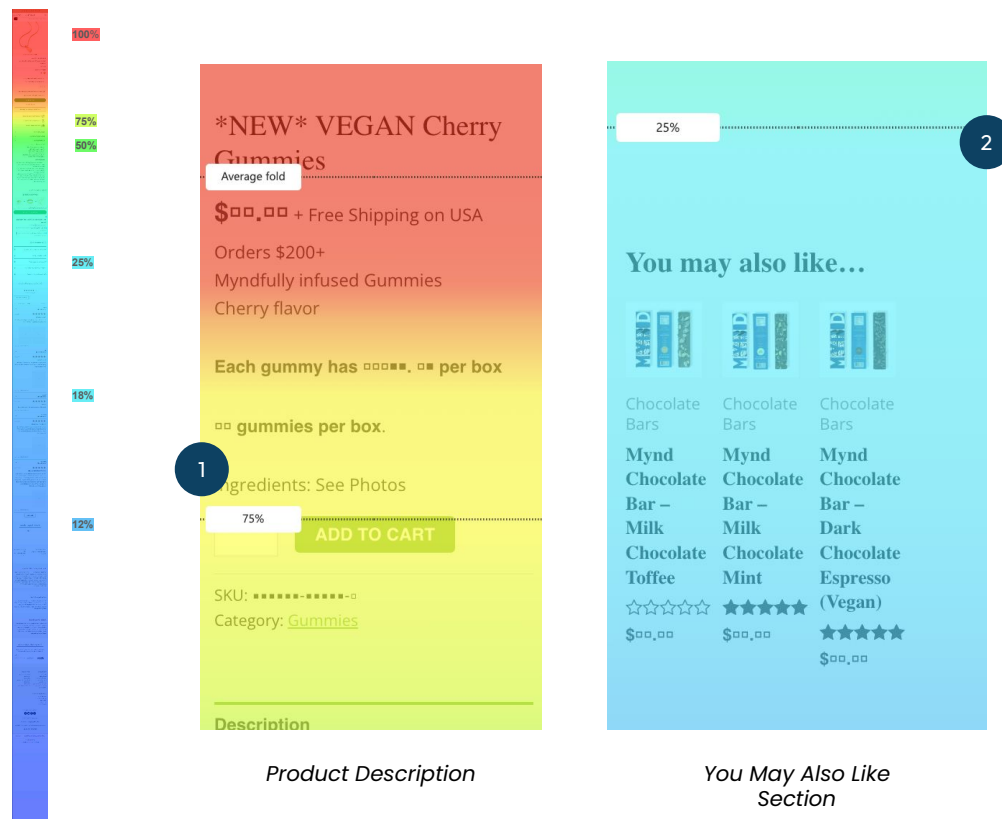

PP-Areas of HIGH interest

1. 75% of users see our product information at the beginning, indicating it is an important section for strong gallery images, videos, content, and clear product descriptions.
2. 25% of users reach the end of the page where alternative products appear, so adding up-selling options and other product mentions earlier in the page can help.

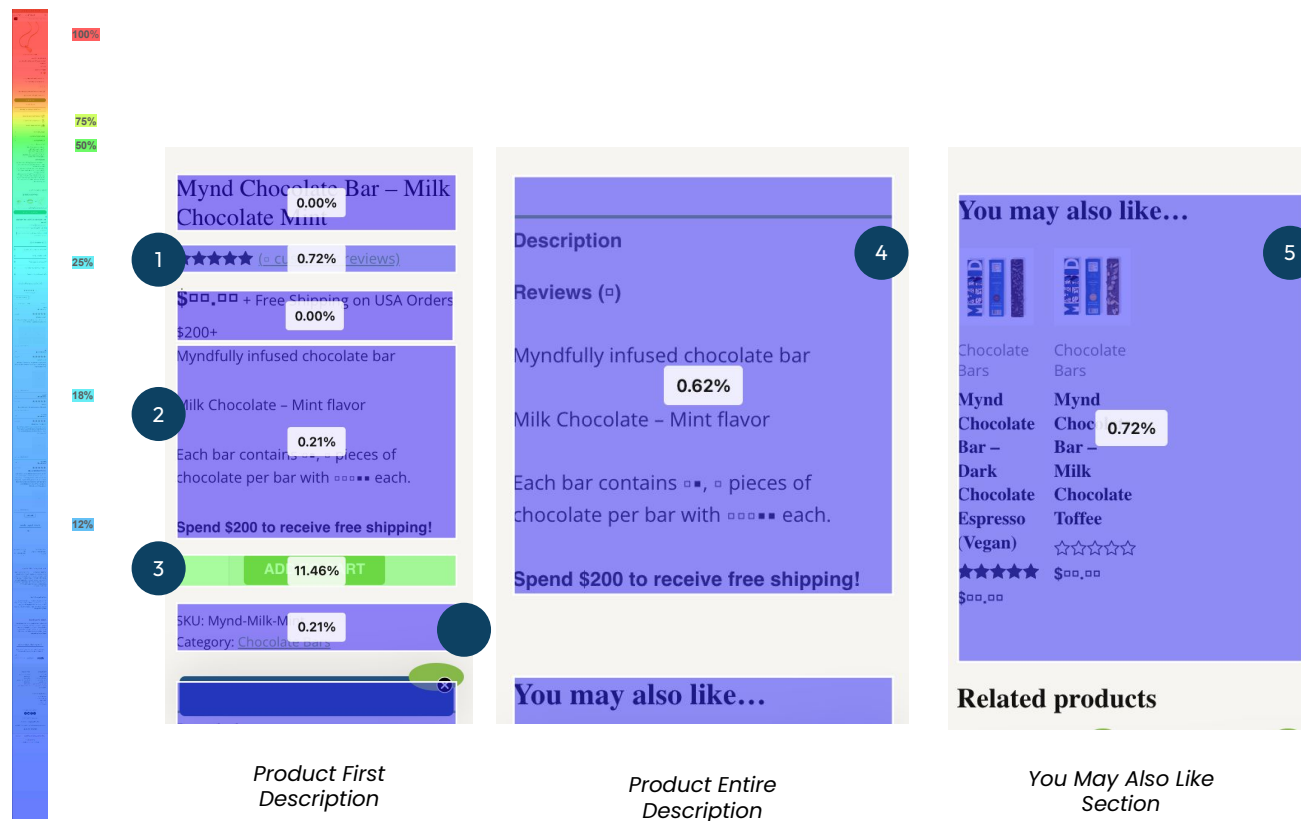

PP-Areas of HIGH interactivity

1. The Reviews stars is the most clicked area.
2. Few people are clicking on the description, even after spending a lot of time reading and checking the information.
3. 11% of users click the add-to-cart button, showing that our product does not require a lot of information to persuade people; we just have to be precise.
4. The second product description receives three times more clicks than the first, making it more effective at describing our product.
5. The YMAL section also receives many clicks, indicating strong interest from users in navigating between different products.

Key Takeaways | Heatmap Analysis

1. **Clarify the hero message:** Make the main banner and product description easier to understand quickly, keep the current hero layout, and remove the brain icon as a “fake” CTA while keeping the logo in the header.
2. **Social proof:** Users spend a lot of time reading reviews and frequently click the rating stars, so reviews and ratings should be more prominent and closer to the add-to-cart button.
3. **Prioritise high-interest categories:** “Shop” and “Chocolate Bars” are the most clicked menu items, while “Capsules” underperforms, so chocolate bars should remain the primary focus
4. **Fix drop-offs on the Collection Page:** Reduce drop-offs by moving best-selling bars and high-value bundles higher in the grid, surfacing sorting and filters above the products, and testing infinite scroll for the small catalog so more users explore the full range and reach the box options.
5. **Restructure the Product Page for persuasion:** The gallery, first description block, and related products get the most attention; keep key benefits and concise copy near the top, follow the stronger second-description pattern, and show “You may also like” items earlier.
